

B. Identify management requirements and prepare a plan

Steps 7 to 9

After site values have been assessed, it is possible to work out priorities and requirements for management and to develop a conservation management plan. The management aims and desired results will vary, depending on the conservation significance of the site, land uses and the personal requirements of the landholder.

Decisions for the land manager	Examples
Management aims and desired results for each management unit	Increase regeneration of native plants.
Management activities for each of these units	Exclude livestock periodically by erecting secure fencing; undertake a weed control program in the unit.
Priorities for management between and within management units	Secure fencing first to ensure stock are contained. Treat the weeds once the movement of stock is controlled.

Guidelines for determining aims are in Step 7. Step 8 assists in identifying specific management issues and actions to address the issues. The general management principles enclosed help to determine management activities that assist in enhancing conservation significance. Publications and agencies that can help with development of management plans are listed in the reference section.

After identifying issues important for conservation and ecological functioning, a work program needs to be developed to ensure that the plan can be implemented.

Step 9 shows how to develop a work program to carry out the activities identified in Step 8.

B. Identify management requirements and prepare a plan

PROCESS	STEP	RESULTS
Define what needs to be done	7 Develop aims and desired results	Aims are developed to achieve conservation and other desired results.
Identify activities required to manage the site to retain conservation significance	8 Identify issues and the management actions that address these issues	Management issues based on site attributes and management requirements are clarified. Activities required to meet aims are identified.
Plan when these activities are to occur	9 Develop a work program for management actions and undertake the activities	Suitable timing for management activities is identified. Activities are undertaken according to the work program.
